A chemical reactor is an enclosed volume in which a chemical reaction takes place. In chemical engineering, it is generally understood to be a process vessel used to carry out a chemical reaction, which is one of the classic unit operations in chemical process analysis.

ABSTRACT. This work presents an experimental study of purification of a biogas by removal of its hydrogen sulphide ( $H_2S$ ) content. The  $H_2S$  was removed by means of chemical absorption in an iron-chelated solution catalyzed by Fe/EDTA, which converts  $H_2S$  into elemental sulphur (S).

INTRODUCTION. New methods to generate energy have been investigated in the last decade due to concerns about the depletion of fuels. Hydrogen is a promising source of energy because this gas affords a clean and high heat of combustion.

The results of the effect of agitation rate on zinc and copper dissolution by 30%  $H_2SO_4$  with leaching time 10 min and at  $35^\circ C$  investigated in the range of  $60\text{--}400$  rpm with liquid/solid mass ratio of 5/1 are shown in Fig. 1.

For material flowing through a volume, the residence time is a measure of how much time the matter spends in it. Examples include fluids in a chemical reactor, specific elements in a geochemical reservoir, water in a catchment, bacteria in a culture vessel and drugs in human body.

1. Introduction. Modern chemical gas sensors (e.g. chemoresistive  $SnO_2$ ) are particularly suitable for hand-held breath analyzers or indoor air monitors due to their extremely compact design, simple application and low cost in contrast to gas chromatography-/mass spectrometry-based techniques.

Numa definição genérica, reator químico é um recipiente onde ocorrem reações químicas, transferências de massa e calor. Em engenharia química, reatores químicos são vasos projetados para conter reações químicas de interesse e escala industrial.
