ELEPHANTS DAMAGE AND KILL TREES. THIS behaviour often appears to be excessive because their immediate, subsequent consumption of edible parts of these trees is often negligible.

(PDF) Why do elephants damage savanna trees?

for grazing ungulates. Grass species composition beneath and outside of tree canopies was determined in a savanna system of Kruger National Park, South Africa. Direct observations were used to test whether grazing ungulates, i.e., impala, Burchell's zebra and blue wildebeest graze relatively more often beneath than outside of large tree canopies. Additionally, it was investigated whether ...

Grazing ungulates select for grasses growing beneath trees

The Bermuda grass that many plant in their lawns is native to the African savanna as is elephant grass, which can grow 10 feet (3 m) tall. Because the rainfall only lasts about half the year, it is difficult for trees to grow in savannas, but it's not impossible.

The model includes key processes such as tree-grass competition, fire, and resource-based density dependence and adaptive movement by herbivores. We used the model to project the ecosystem 100 years into the future from its present state under different fire, browsing (determined by elephant population density), and grazing (with and without wildebeest present) regimes. The model produced ...
